Marcellus Shale Project Location

Marcellus Shale Stratigraphy

System	Ohio	N. Virginia and West Virginia	Western Maryland	Western Pennsylvania	Northwestern New York	International Stage
Middle Devonian		Harrell Shale	Harrell Shale	Harrell Shale	Genesee Fm.	Frasnian
	Olentangy Shale	Tully Limestone		Tully Limestone	Tully Limestone	Givetian
	Prout Limestone	Mahantango Formation	Mahantango Formation	Mahantango Formation	Moscow Shale	
	Plum Brook Shale				Ludlowville Shale	
	Delaware Limestone				Marcellus Shale	
	Columbus Limestone	Marcellus Shale			Marcellus Shale	Marcellus Shale
	Bois Blanc Limestone	Huntersville Chert	Needmore Shale	Needmore Shale	Marcellus Shale	
Lower Dev.				Selinsgrove Limestone	Onondaga Limestone	Emsian
				Needmore Shale	Bois Blanc Fm.	

Obstacles to Production

- **Topographical features limiting:**
 - **Surface hole locations**
 - **Water disposal and supply**
- **Roads restricted to heavy equipment**
- **Limited pipeline capacity**
- **Limited drill site options**
- **Multi-well pad drilling required**

Historical Factors

- **Selection of tools and technologies**
- **Single, vertical wells**
- **Air drilling limitations**
- **Minimal surveying data**

Historical Approach

- 17.5-in surface hole air-drilled blind
- 12.25-in water protection string air-drilled
 - Trips optimized based on drop in ROP
- 8.75-in section air-drilled as deep as possible
 - Minimize tangent sail angle
 - Dropping tendency of 3-5° per 100 ft
 - Roller reamers used to minimize stick-slip

Proactive Multiwell Pad Design

- Seven pairs of wells in Marcellus and Other
- Pad designed to minimize risk of well collisions
- Contractor/Operator agreed on Anticollision Standard
 - Areas of uncertainty defined for 1,000, 2,500 & 5,000-ft TVDs
 - Detailed surveying program
 - North Seeking Gyro used to maximum 20° inclination
 - MWD used once sensors are free of external magnetic interference, through TD

Wellbore Profile

Wellbore Profile

- **17.5-in section**
 - TVD ~ 1,000 ft
 - Air drilled
 - No directional control
- **12.25-in section**
 - TVD ~ 2,500 ft
 - Air drilled
 - Minimum directional control
 - Maximum DLS 1.25°/100 ft
 - Sail angle 13-20°
- **8.5-in section**
 - TVD = target reservoir
 - Maximum DLS 10°/100 ft

Pad Design Collaboration

- Contractor receives draft set of surface/target coordinates
- Preliminary pad visualization created
- Iterations for target/surface-hole assignments
 - Avoid trajectories crossing at any depth
 - Optimize total footage drilled
 - Minimize flat time

Initial Slot Map with Naming Conventions

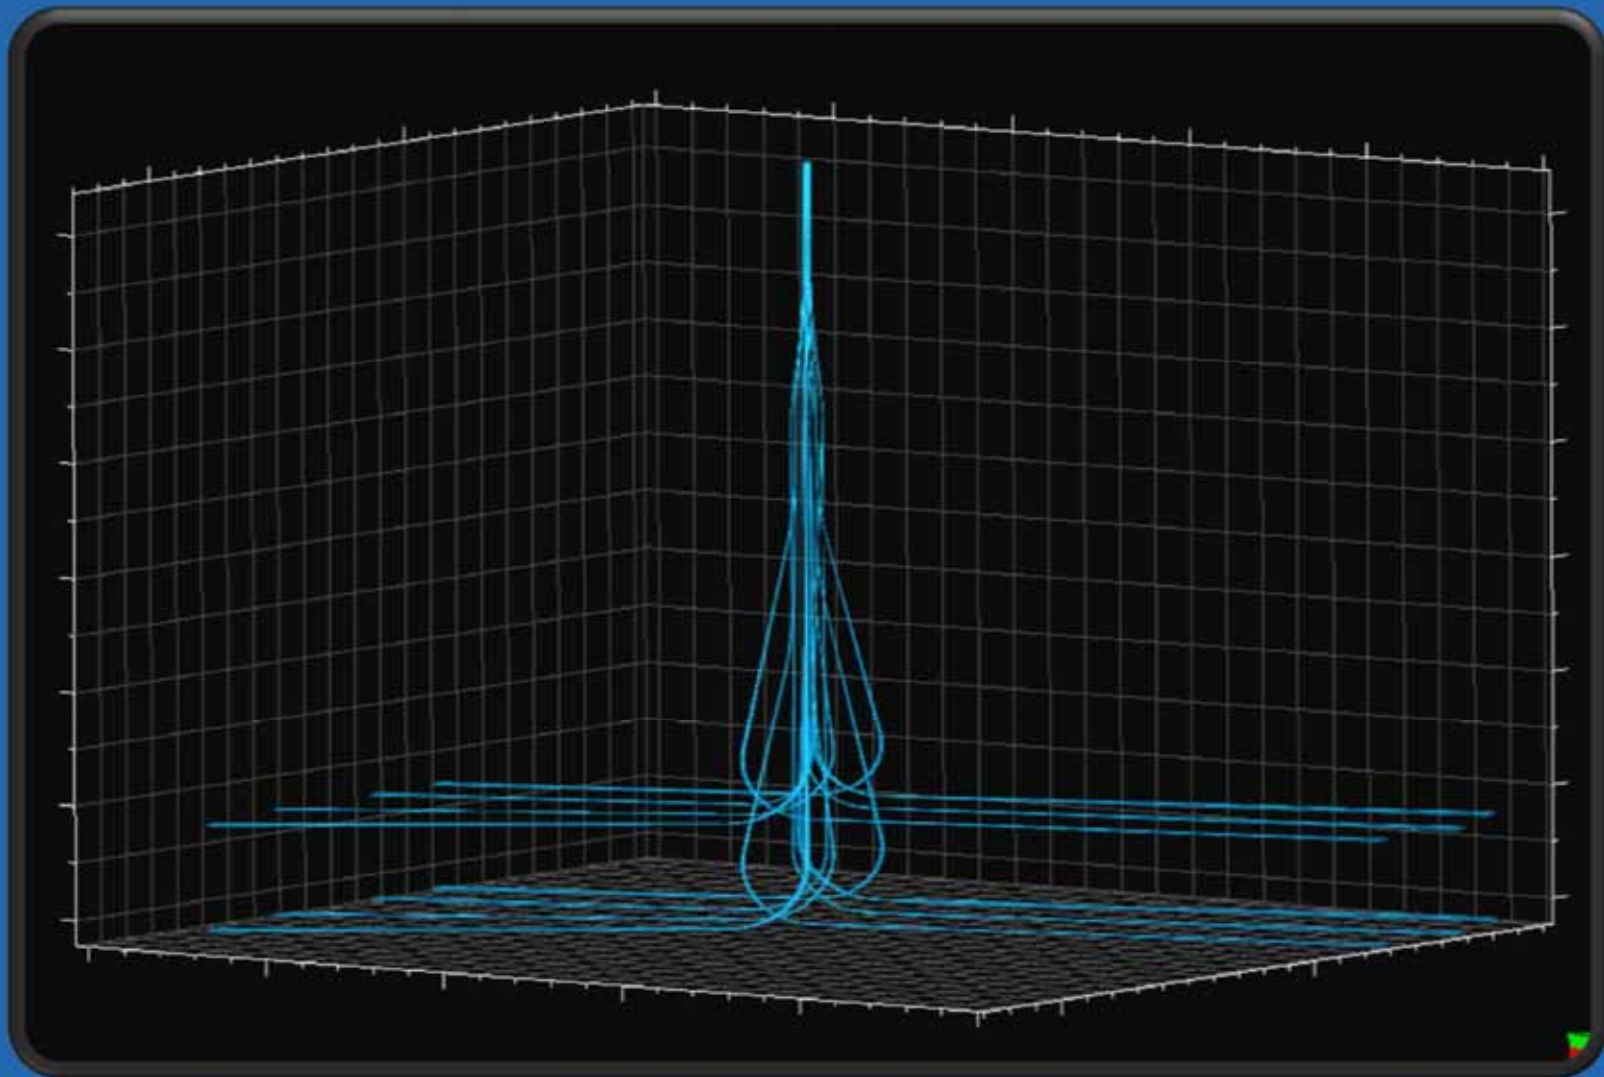

Initial Pad Design

Wellbores separated to landing points

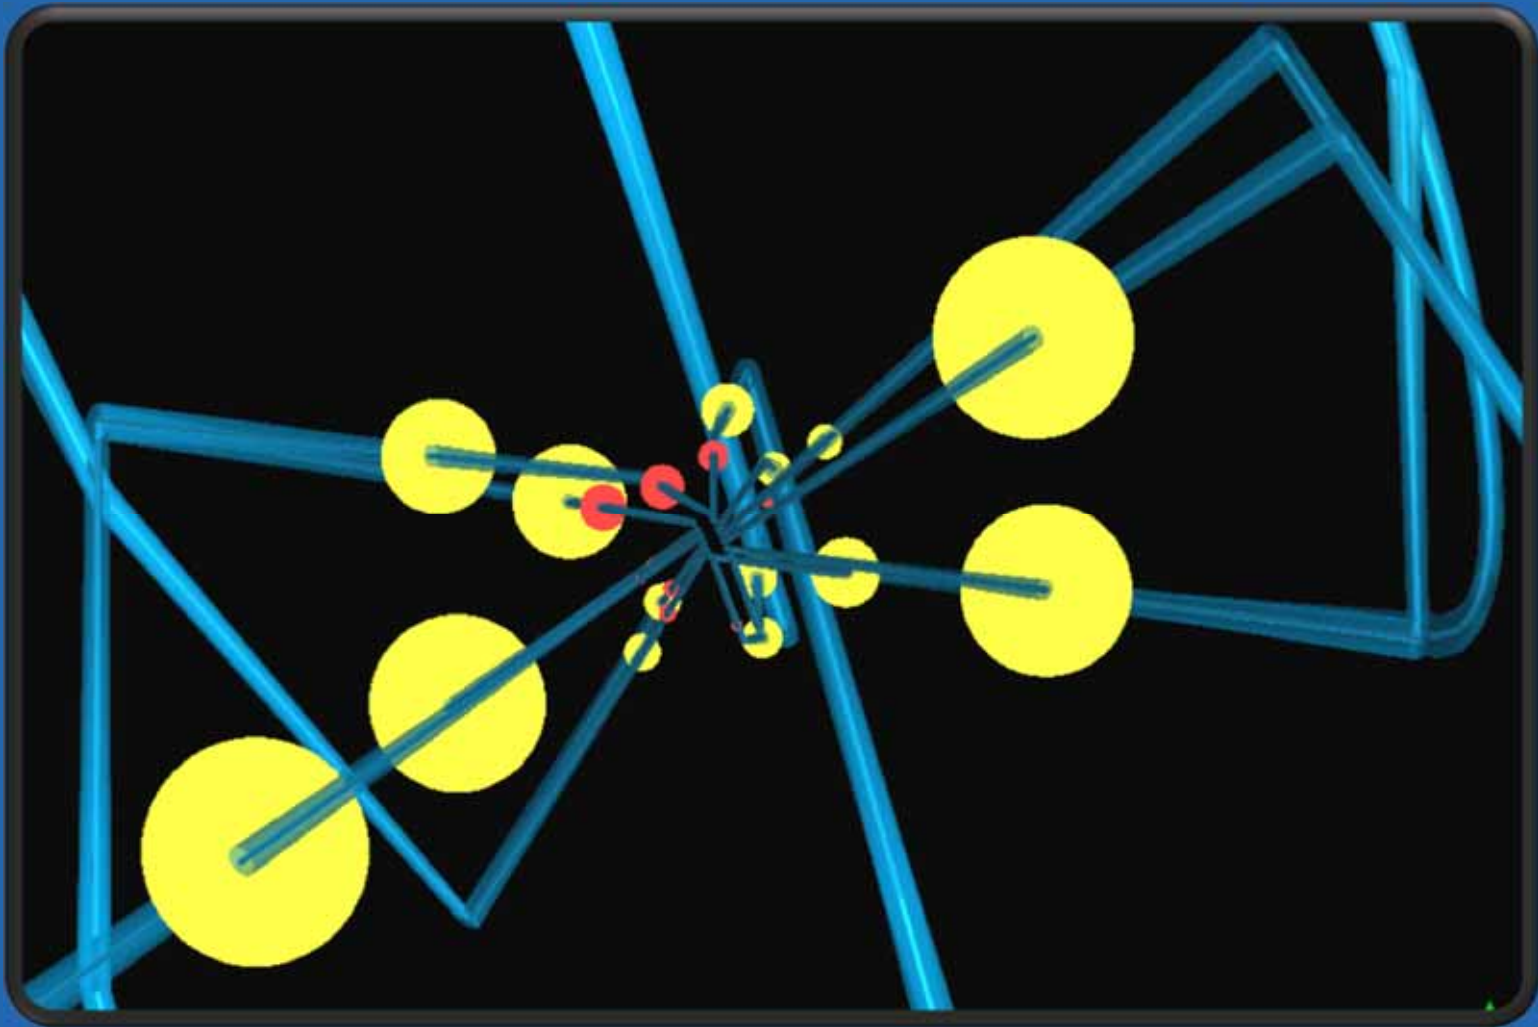

Initial Pad Design

Initial Pad Design

Initial Pad Design

Uncertainty areas added at 2,500 ft and 5,000 ft TVD provide accountability of deviation from plan.

Pad Design Revisions

- **Surveyed surface-hole coordinates received**
- **Geological targets revised**
- **Target/Slot pairing revised per permitting requirements**

Well Name	Reservoir	Slot Options
AA55-T	Marcellus	A,B,C,D
AA56-T	Marcellus	A,B,C,D,E,F
AA57-B	Marcellus	A,B,C,D,E,F,G
AB77-B	Other	A,B,C,D,E,F,G
AB78-T	Marcellus	B,C,D,E,F,G
AB79-B	Other	C,D,E,F,or G
AB70-T	Marcellus	E,F,G

Final Pad Design

- **Created after Phase 1 surface holes drilled/surveyed.**
- **Re-planned wellbores based on actual surface hole trajectories**
- **Reassessed anticollision requirements**
- **Recalculated areas of uncertainty**

Final Slot Assignments

Red = Phase 1, Blue = Phase 2

Final Pad Design

Red = Phase 1, Blue = Phase 2

Final Pad Design

Red = Phase 1, Blue = Phase 2

Final Pad Design

Red = Phase 1, Blue = Phase 2

Conclusion

Drilling program continues to evolve

- New techniques**
- Fit-for-purpose technologies**

Pad design represents step-change in regional reservoir development

- Incorporates lessons learned in offshore environments**
- Collision risks and associated costs reduced**
- Multiple wells from single-well footprint yields better project economics**
