Phil Harbidge

PathControl 2017 – Present

21 Years working on directional survey and well positioning, drilling engineering and well placement special projects

PathControl Specializes in :

- Directional Survey Database and survey Management
- Relief Well, Plug & Abandonment and Blow Out well Intercept services
- Magnetic Ranging, Collision Avoidance, Advanced Directional Software Audit and Setup

Wellbore Positioning Technical Section

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Overview:

- Why we are talking about 3-d positioning uncertainty
- True along-hole (TAH) depth
- Generic correction and uncertainty model components
- Correction model uncertainty
- What is new

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Along hole Depth is Tied to the Seismic Section

Structural Uncertainty

Estimated structural uncertainty in the seismic image displayed as displacements.

Along-hole depth uncertainties

Image Taken from :

Structural uncertainty of time-migrated seismic images, Sergey Fomel and Evgeny Landa, <u>Journal of Applied</u> <u>Geophysics,</u> Volume 101, February 2014, Pages 27-30

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Asset Lifetime Uncertainty

Measurement relevance	Domain relevance	Uncertainty @ 10,000 ft
Seismic 3-d geologic mapping	Major geological events	+/- 100 ft
Well construction	Significant reservoir events	+/- 50 ft
Mechanical service operations	Minor reservoir events	+/- 30 ft
Reservoir geometry	Major bed events	+/- 15 ft
OWC/GWC mapping	Minor bed events	+/- 5 ft
Detailed OWC/GWC mapping Fracture identification	Minor bed events	+/- 2 ft
Across reservoir fluid level management	Detailed fluid levels Compaction events	+/- 1 ft

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

TVD Uncertainty Value?

Oil, Gas and Water companies Uncertain of the Effect Uncertainty has on their Asset Value and Production Efficiency

Ed Stockhausen (Chevron 1970 - 2055) stated : "1 ft of TVD error costs 10k to 100k Bbls" = *\$600k to \$6,000k*

API RP-78 includes the requirement for well data along-hole depth uncertainty as a QA/QC requirement.

Wellbore Positioning Technical Section

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

TVD Uncertainty Value?

Difference log depth vs drillers depth

- "Incorrect True Vertical Depth can affect project estimated project pay value and production rates"
- "Extreme cases : Up to 1 MM bbl per TVD foot Error in Reservoir Modeling and Production Rate Estimates"

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

What is True Along-hole (TAH) Depth?

Wireline, drill pipe or any other - observed depth

Depth measurement + Correction +/- Uncertainty

= True Along-hole Depth, TAH

Corrected depth together with an uncertainty term defining the uncertainty reported to one (1)-sigma*

This is applicable to all AHD data values

* ref.: Along-hole Depth Rev6.0, www.lulu.com

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

ISCWSA current terms (2021)

Reference, Measurement/calibration, CORRECTION

- Reference errors systematic (survey datum, wind, tides, weather, CABLE SAG)
- Reference errors random (waves, weather tides/ballast, pipe stick-up, log picks)
- Scale factor errors systematic (MWD/LWD) (tape measure, measurement temperature, WEIGHT-ON-BIT, PUMP-OFF, DIFFERENTIAL PRESSURE, ANNULUS DRAG, NOZZLE THRUST, ROTARY TORQUE)
- Scale factor errors well by well (wireline) (wireline wheel wear, WHEEL SLIPPAGE, marking temperature, marking accuracy)
- Stretch type errors systematic (wireline) (wireline INELASTIC stretch, TEMPERATURE, PRESSURE, TORSION) Stretch type errors – global (MWD/LWD) (DRILLPIPE ELASTIC STRETCH, TEMPERATURE, HYDROSTATIC)
- Brooks, Wilson, Jamieson & McRobbie, SPE-956111

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Industry Depth Uncertainty Changed ISCWSA Error model Sub-Committee summary Rev5.03

Shows output of variety of ISCWSA EM depth uncertainty Illustrates disconnect of the output to real world conditions Model values have changed over time (Rev 0 – 5), while not referencing actual measurement conditions, calculation and Uncertainty

Propose Actual Measurement values used to propagate the Error model Depth Terms

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Opportunity for Industry to manage AHD Uncertainty

- Realities of real world well conditions
- Measurement technology used
- Drill string architecture and rig state
- Measurement and correction accuracies
- Correction model accuracies and options
- Uncertainty requirements/expectations set

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

What's New – Proposed Uncertainty Components

- Reference integrity and stability
- Length measurement calibration accuracy
- Correction accuracy
- Correction model fit
- Uncertainty calculation

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

References Need to be Managed

Travelling block + movement

Drill pipe measurement reference point locational position and stability uncertainty

Zero Depth Point ZDP

Elevation

Tide movement

Wave motion

Permanent datum MWD/LWD clock synchronization Tool Joint

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Different Drillpipe Depth Correction Calculations

Correction method

Elastic stretch for pipe freely suspended (Reistle & Sikes, 1938)

Elastic stretch for mixed strings freely suspended (Reistle & Sikes, 1938)

Elastic stretch (Milan, 1992)

Elastic stretch (Esketh, 1998)

Elastic stretch and temperature (Gabolde & Nguyen, 2006)

Elastic stretch (Pedersen & Constable, 2006)

Elastic stretch (Baker Oil Tools, 2011)

Driller's Way-point Depth (Bolt, 2017)

Wellbore Positioning Technical Section

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

New: Average Correction Value at Any Point

Average correction value = $\frac{\int_{ZDP}^{aepth}(polynomial)}{depth}$

The average correction at a given point is the correction averaged between the given point (survey Station) and the ZDP

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

New: Way of Determining Correction Uncertainty

• Difference between the Traditional Industry theoretical (modelled) correction value and the applied correction value is the error of the applied correction

$$\frac{u}{Z} = \frac{\left|\int_{ZDP}^{depth} correction \ polynomial - \int_{ZDP}^{depth} real \ polynomial\right|}{\int_{ZDP}^{depth} real \ polynomial}$$

The accuracy of the model is calculated by subtracting the areas under the two polynomial curves

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Choosing a Typical Survey Program Accuracy Range

• DwpD: measurement stations, during POOH, constant speed, simple sliding motion, discrete intervals with (near) linear progression of correction parameters.

Measurement	Method	Typical accuracy
Pipe length calibration	Strapped pipe	+/- 0.05% to 0.2%
	Lasered pipe	+/- 0.015% to 0.02%
	Additional on-site variance	Accuracy +50% to +100%
Tool joint error	Rig floor visual	+1 ft to +3 ft
Surface hook load	Dead weight sensor	+/- 5% to +/- 10%
BHA mud temperature	LWD sensor	+/-1%
Stretch coefficient	Young's Modulus for steel	+/-5%
Thermal expansion coefficient	Thermal coefficient for steel	+/- 5%

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

New: The Role of Polynomials

- Historically :
 - Tension / Compression, Reference and Temperature effects models were typically not widely used
- Proposed :
 - Well site drilling data to be used on a per Measurement Station basis to create Correction Parameter Profiles
 - Þε
 - Each Measurement Station has a bespoke correction value AND uncertainty value
 - This arrives at TAH Depth

Wellbore Positioning Technical Section

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Case Example

- ➢ 15000ft , North Sea well
- Logged on Drill pipe, depth with DwpD
- Used 7 measurement stations
- ➢ Produced :
 - Correction Polynomial
 - > AHD Uncertainty Polynomial

Wellbore Positioning Technical Section

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Case Results

Purple Ellipsoids No TVD corrections No Depth correction TVD vertical = +/- 71 ft Purple Ellipsoids Advanced inclination correction No depth correction TVD vertical = +/- 68 ft

Yellow Ellipsoids No inclination correction High accuracy Depth Correction TVD vertical = +/- 35 ft

Yellow Ellipsoids High accuracy inclination High accuracy Depth

Correction TVD vertical = +/-27 ft.

True Vertical Depth has independently calculated Uncertainty, reported at 3-sigma

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

What's New ?

- Correction Parameters measured POOH Drill string in tension in simple sliding motion
 - Correction incremental from TD to ZDP
 - Correction Uncertainty at each measurement correction station

\blacktriangleright Directional survey log with corrected AHD value and uncertainty

- Replace ISCWSA Depth Uncertainty Terms with Calculated Depth Uncertainty Polynomial
- New survey Ellipsoid of Uncertainty volumes
 - ➢ 3-d visualization, more robust geo models, Improved well placement knowledge

The Industry Steering Committee on Wellbore Survey Accuracy (ISCWSA)

Improvement Potential

- ➢ Reduced Vertical Depth Uncertainty when needed
- ➤ Geo modelling
 - > Define bed boundaries with reduced Wireline vs Drill Pipe LWD Vertical Depth Difference
 - ➤ Well placement landing the well
 - Pay thickness confidence
- ➢ Fluid contact determination
 - ➢ Reduce early water cut
- ➤ Casing shoe depth
 - Manage pressure ramp before and while intersecting high / low pressure zones
- ➢ Geo-structure and geohazard
 - Fault or fracture zone management
